Hiring Team

Novino AI

Dear Hiring Manager,

I'm excited to apply for the Junior/Intern Software Engineer position at Novino AI. Your mission to build an AI-powered Laboratory Information System that improves diagnostic workflows and patient outcomes aligns perfectly with my technical background and interest in applying software engineering to meaningful real-world challenges. With production experience in FastAPI, React, and MongoDB—the exact stack you're using—I'm ready to contribute immediately to your platform.

At Centigrade, I rewrote critical API services in FastAPI and optimized database operations, supporting a 5x increase in query throughput while reducing latency by 60%. I also redesigned frontend interfaces with React and Tailwind CSS, cutting page load times in half and dramatically improving accessibility scores. This experience taught me how to build performant, maintainable systems under real production constraints—skills I'm eager to apply to your LIS platform where speed and reliability directly impact clinical decision-making.

Most recently at CarbonSustain, I architected a full-stack application from prototype to MVP as part of a 2-person founding engineering team. I built Node.js and FastAPI microservices integrated with a PostgreSQL backend, implemented RESTful APIs with authentication flows, and developed an Angular/TypeScript frontend that supported real-time transaction validation for enterprise pilots. I also designed AWS infrastructure with Terraform and established CI/CD pipelines for zero-downtime releases. This experience gave me end-to-end ownership of features and taught me how to balance rapid iteration with code quality in an Agile, startup environment.

Beyond my professional work, I've demonstrated strong problem-solving abilities through research and blockchain development. At UC Berkeley's RISE Lab, I led a 5-person research team investigating consensus protocols and co-authored a peer-reviewed paper on Byzantine fault tolerance—experience that strengthened my understanding of distributed systems and collaborative technical work. I'm also familiar with Git workflows, Jira, pytest, and have written extensively documented code throughout my career.

What excites me most about Novino AI is the opportunity to work at the intersection of healthcare, AI, and enterprise software with experienced founders who have successful exits. I'm particularly interested in how AI-powered diagnostic support can reduce turnaround times and improve patient outcomes, and I'm eager to learn about healthcare standards like HL7 and FHIR while contributing to features across your stack.

I'd love to discuss how my experience with FastAPI, React, MongoDB, and Agile development can help Novino AI deliver tools that make a real difference for labs, clinicians, and patients. Thank you for considering my application.

Sincerely,
Kentaro Vadney
