Hiring Team

Sago

Chicago, IL

Dear Hiring Team,

I'm excited to apply for the Software Engineer, Agentic AI position at Sago. Your mission to build the operating system for AI-enabled venture funds resonates deeply with me—I've spent years at the intersection of AI development and financial technology, and I'm eager to bring that experience to a team reimagining how VCs operate.

My background combines hands-on agentic AI development with direct exposure to the venture ecosystem. At Centigrade, I built an AWS Kendra-powered AI search and summary system, designing the Python backend that enabled intelligent information retrieval across the product. At Belden, I developed LLM-integrated tools and optimized machine learning pipelines processing 200+ GB datasets—experience directly applicable to the data management challenges inherent in portfolio intelligence. At CarbonSustain, I delivered custom demos leveraging LLM APIs that secured enterprise pilots, demonstrating my ability to translate AI capabilities into tangible business value.

What sets me apart for this role is my venture capital perspective. As a Product Analyst at the Berkeley Blockchain Accelerator, I evaluated 50+ startups—several of which later raised over \$650M in funding. I understand how investors think, what signals matter in deal flow, and the pain points in portfolio management. This isn't just a technical role for me; I genuinely understand the problem space.

On the technical side, I bring strong Python and API development skills (FastAPI, Flask), cloud infrastructure experience (AWS, Kubernetes, Docker), and a track record of shipping production systems. I'm comfortable with prompt engineering, LLM integration, and building reliable backend services—exactly the stack required to develop and deploy robust AI agents.

I'd welcome the opportunity to discuss how my combination of AI engineering skills and VC ecosystem experience can help Sago build the future of AI-enabled investing.

Best regards,

Kentaro Vadney
